Introduction

71546 is an olivine-microporphritic ilmenite basalt similar to 71555 (Warner et al. 1978).

Mineralogical Mode

	71546	71555
Olivine	2.7	3.5
Pyroxene	47.8	47.3
Plagioclase	27.7	28.9
Opaques	17	16.4
Silica	3.9	3.2
Meostasis	0.8	0.6

Figure 2: Map of station 1, Apollo 17.

71525 - 71596 etc. are rake samples collected as part of a comprehensive sample at station 1, taken near Steno Crater, Apollo 17 (figure 2). They include numerous small ilmenite basalts.

Petrography

The texture of 71546 is variable, from fine-grained variolitic areas to coarser granular areas (figure 4).

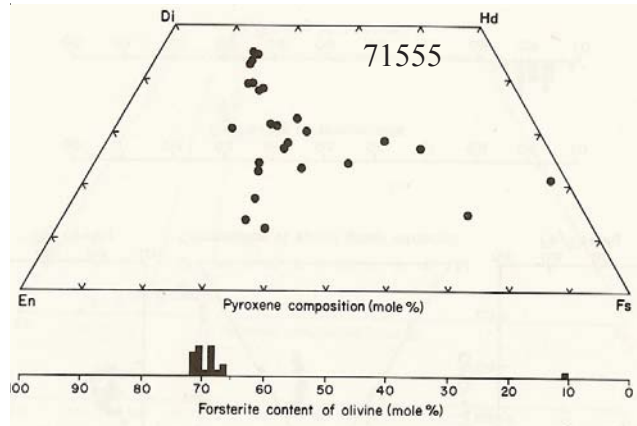

Figure 3: Composition of pyroxene and olivine in 71546 and 71555 (Warner et al. 1978).

Some areas are locally microporphyritic. Pyroxene grains are largest and enclose ilmenite and plagioclase. Olivine is not abundant. See Neal and Taylor (1993) for details.

Chemistry

Eldridge et al. (1975), Warner et al. (1975) and Rhodes et al. (1976) reported the composition of 71546 and 71555 (nearly identical). These samples appear to be intermediate to type A and type B basalts.

Radiogenic age dating

Nyquist et al. (1976) determined Rb, Sr and Sr^{87/86}.

Cosmogenic isotopes and exposure ages

Eldridge et al. (1975) determined the cosmic-ray-induced activity of ²²Na = 94 dpm/kg/, ²⁶Al = 70 dpm/kg and ⁵⁴Mn = 165 dpm/kg.

Processing

There are 5 thin sections for 71546, but only one for 71555.
