Figure 2: Photo of 14070. Scale is in cm. S71-22168.

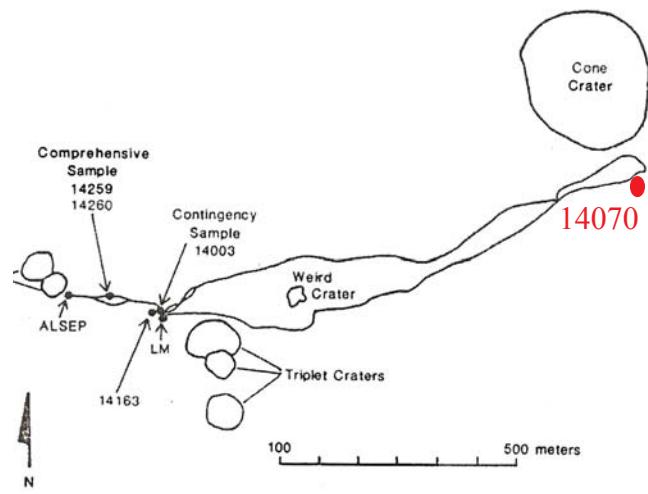

Figure 3: Traverse map for Apollo 14 showing location of 14070 on rim of Cone Crater.

Introduction

14069 and 14070 are small breccia samples that were picked up by tongs from between the MET tracks in the boulder field on the rim of Cone Crater (Swann et al. 1971) (figure 3). They are similar, but have different exposure ages.

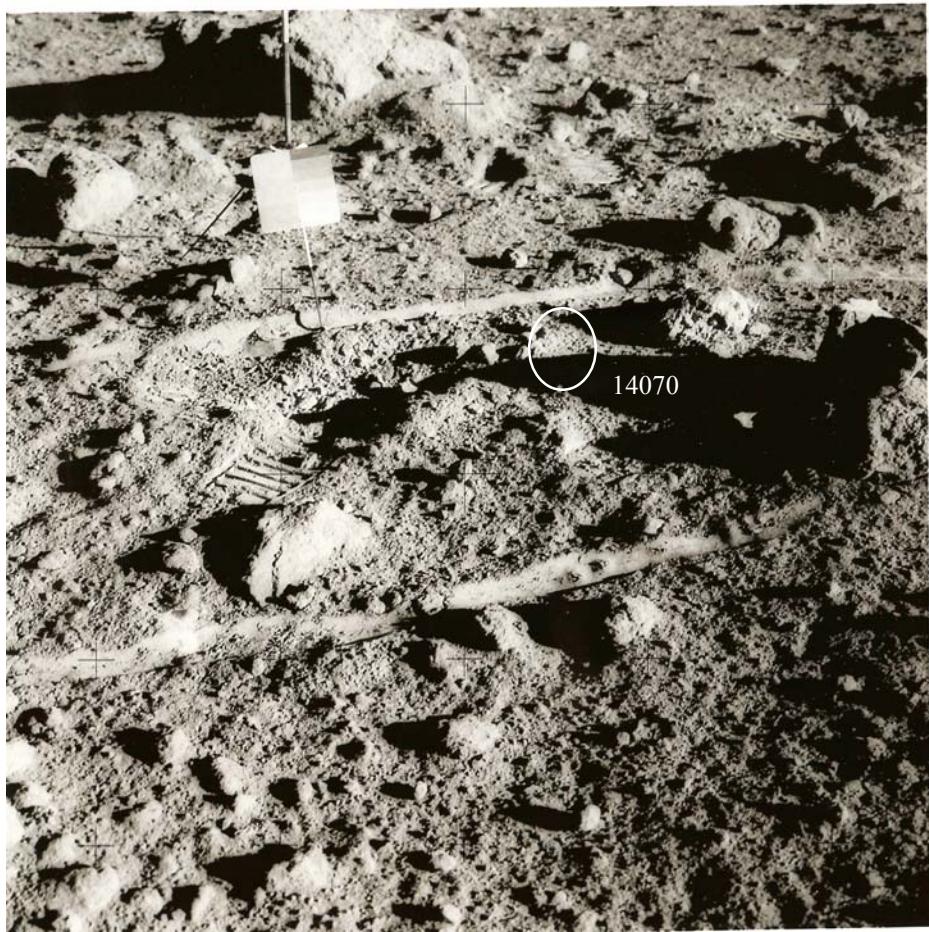

Figure 4: Location of 14070 between tracks left by MET. S71-64-9125.

Petrography

14069 and 14070 are tan impact melt rocks with fine crystalline matrix (Carlson and Kramer 1987). They have vesicles, mare basalt clasts and other similarity with 14321 and are most likely pieces of the Fra Mauro Formation (Wilshire and Jackson 1972, Simonds et al. 1977).

Chemistry

The chemical composition of 14069 and 14070 have not been determined.

Radiogenic age dating

Stadermann et al. (1991) determined Ar/Ar plateau ages of 3.78 ± 0.02 b.y. for 14069 and 3.71 ± 0.02 b.y. for 14070 (figure).

Cosmogenic isotopes and exposure ages

Stadermann et al. (1991) determined an exposure age of 95 m.y. for 14069 and 30 m.y. for 14070 by the ^{38}Ar method.

Processing

These samples were returned, under vacuum, in ALSRC 1006. There are three thin sections each for 14069 and 14070.

scale = 2.8 mm across

Summary of Age Data for 14069, 14070

Ar/Ar

14069	3.78 ± 0.02 b.y.
14070	3.71 ± 0.02

Stadermann et al. 1991

Caution : Ar standard ?
