

**15507**  
Glass Object  
3.9 grams

*Figures 1 and 2: Two views of 15507. Field of view about 1 cm. S71-44539 and 44540.*

**Introduction**

15507 is made up of three glass particles that fit together as a hollow egg. It has not been subdivided nor studied. This sample was collected and returned with 15505 from a site near Hadley Rille – see section on 15501.

**Petrography**

There is a zap pit on the interior wall of the large vesicle, proving that it was already broken on the lunar surface (Ryder 1985).

*Note: the transcript mentions that the astronauts were also trying to pick up a glass ball, but that they dropped it?*
