Plagioclase	67.2
Pyroxene	8
Olivine	16.3
Opaque	1.5

Introduction

67747 is a rake sample collected from the rim of North Ray Crater – see section on 67701. It is a small aluminous basalt with measured age of 3.86 b.y. (Imbrium ?). It has a KREEP-like REE pattern. Vesicles and zap pits can be seen in figure 1.

Petrography

Reimold et al. (1985) and Stoffler et al. (1985) studied this small basalt. Elongate plagioclase and pyroxene laths are poikilitically enclosed in large olivine. Glassy mesostasis is found adjacent to pyroxene. Mineral analyses were reported by Steele and Smith (1973).

Chemistry

Stoffler et al. (1985) reported a major element analysis and the REE diagram for 67747 (figure 5). Reimold et al. (1986) also reported Rb, Sr, Sm and Nd.

Figure 2a: Thin section photo (crossed-nicols) of 67747, 1,

Summary of Age Data for 67747

Rb/Sr	Sm-Nd
Reimold et al. 1985	3.86 ± 0.05 b.y.
	3.6 ± 0.4

Caution: Changing decay constants.

Radiogenic age dating

Reimold et al. (1985) determined an age of 3.86 ± 0.05 b.y. by Rb-Sr internal isochron, but were unable to date it precisely by Sm-Nd (figure 4 a,b).

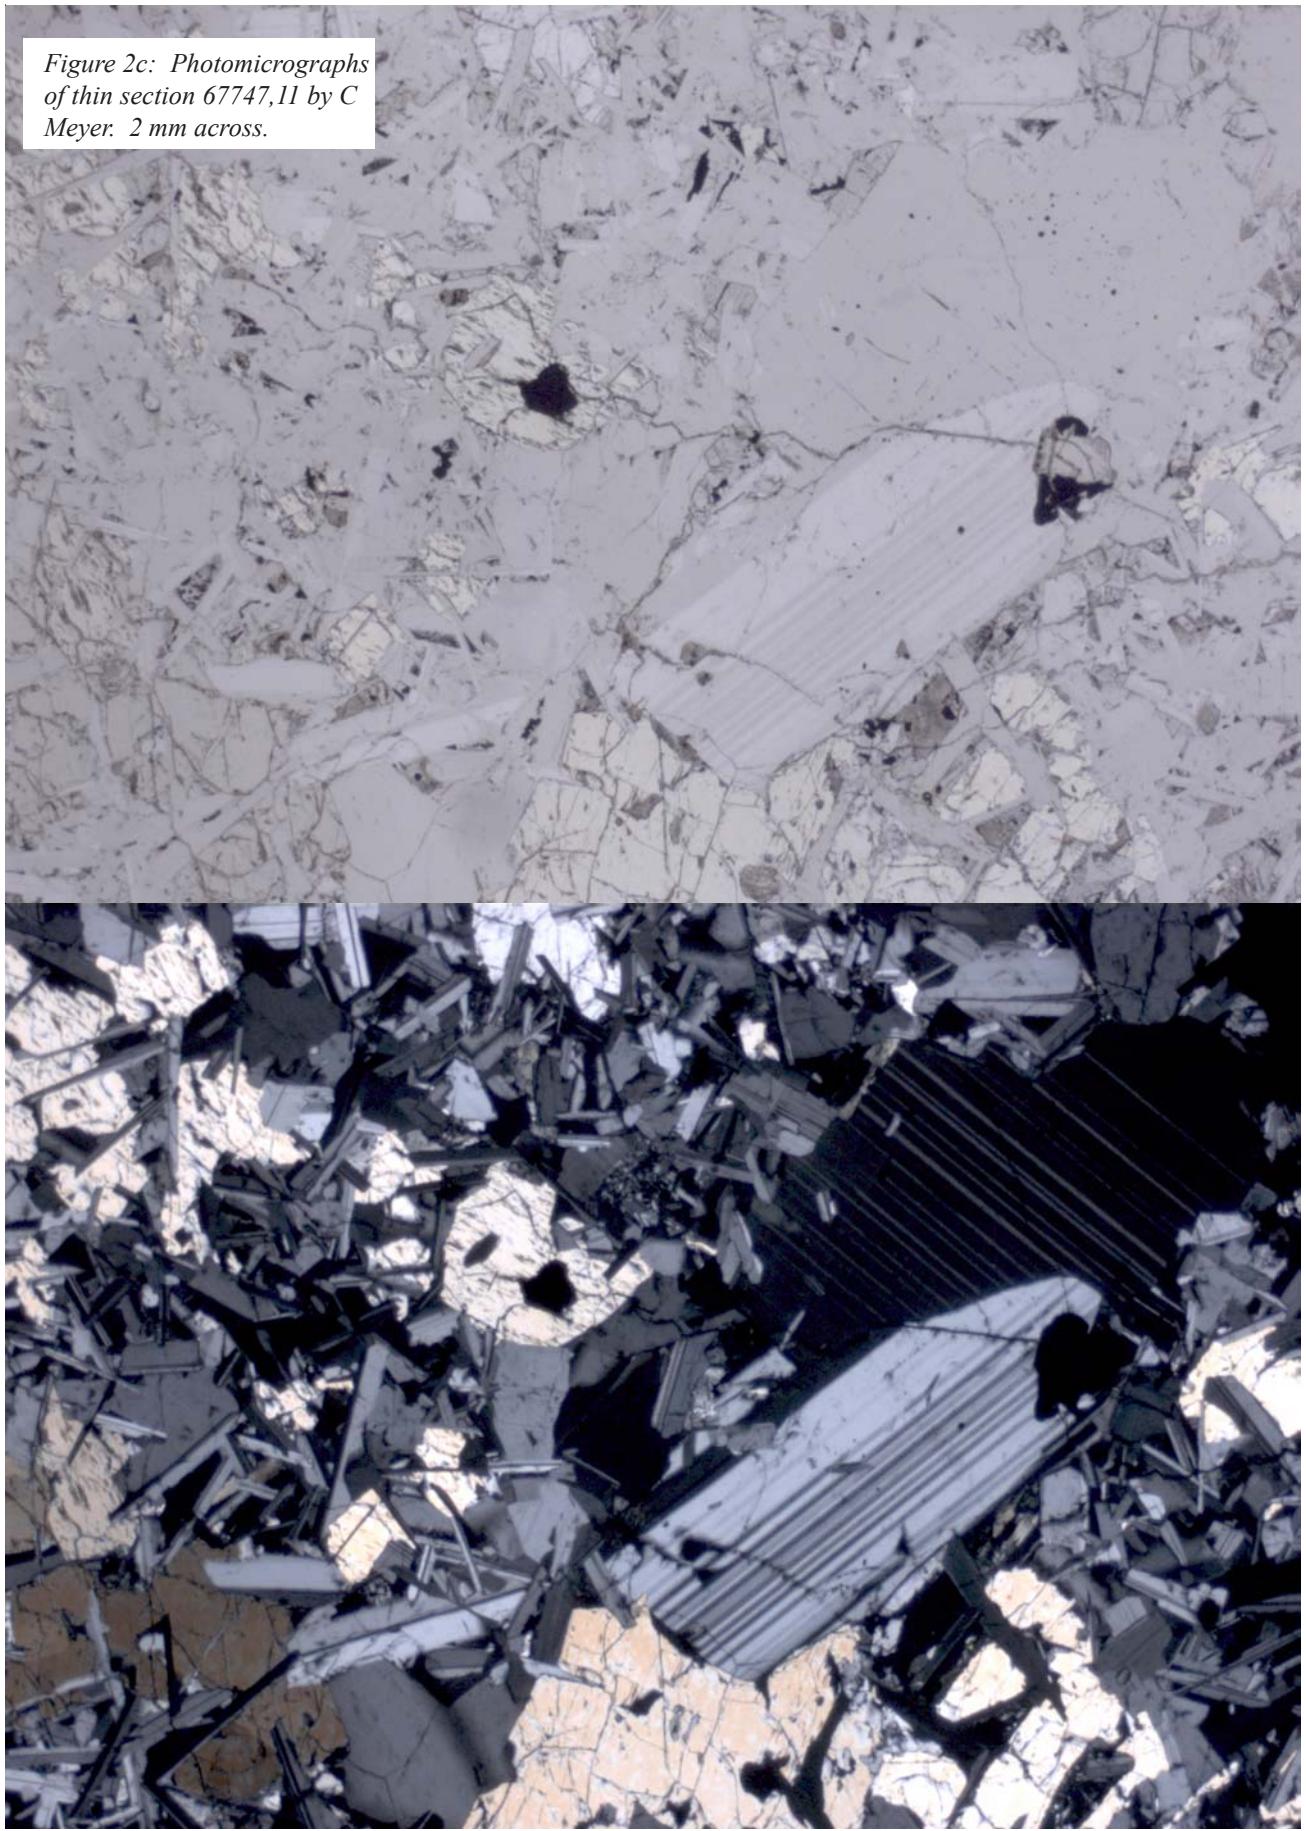

Processing

There are 3 thin sections.
