

**72150**  
**Soil (bag residue)**  
**53.3 grams**

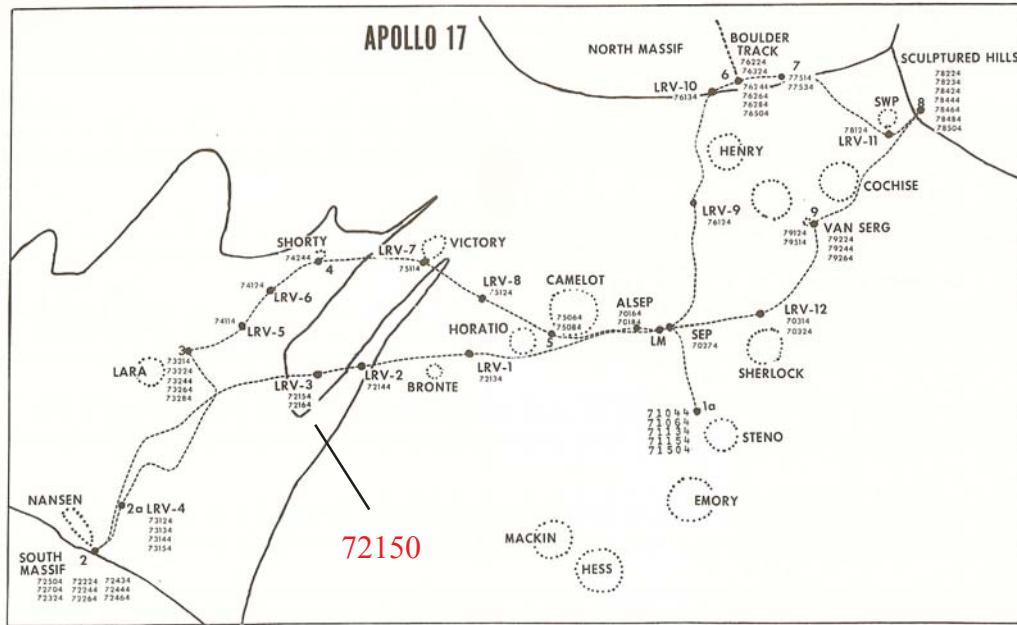

Figure 1: Location of soil sample 72150 at LRV-3 on Apollo 17 map (Meyer 1973). S73-24071

### Introduction

72150 was collected at LRV – 3 along with basalt sample 72155 (figure 1). Although this is a “bag residue”, the high maturity indicates it is a proper soil (*it is not easy to pick up a rock from the regolith surface without getting some soil*).

### Petrography

The maturity index of 72150 is  $I_s/\text{FeO} = 82$  and the average grain size is 50 microns (Morris 1978, Graf

1993). Heiken and McKay (1974) determined the modal content, finding 53% agglutinate.

### Chemistry

The composition of 72150 is intermediate between mare and highland material (figure 2 and 3). It is identical to soil sample 72161 collected at the same location.

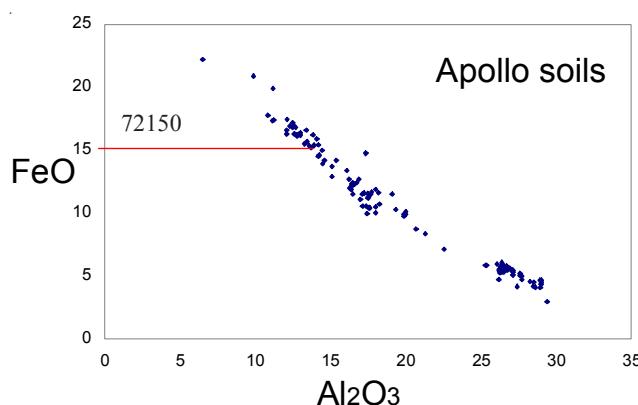

Figure 2: FeO content of 72150 compared with other Apollo soil samples.

### Modal content of soil 72150 (90-150 micron). From Heiken and McKay 1974.

|              | 72159 |
|--------------|-------|
| Agglutinates | 52.6  |
| Basalt       | 9.6   |
| Breccia      | 10.9  |
| Anorthositic | 0.5   |
| Norite       |       |
| Gabbro       |       |
| Plagioclase  | 5.3   |
| Pyroxene     | 5.3   |
| Olivine      |       |
| Ilmenite     | 0.6   |
| Orange glass | 3.9   |
| Glass other  | 10    |
