Soil
386 grams

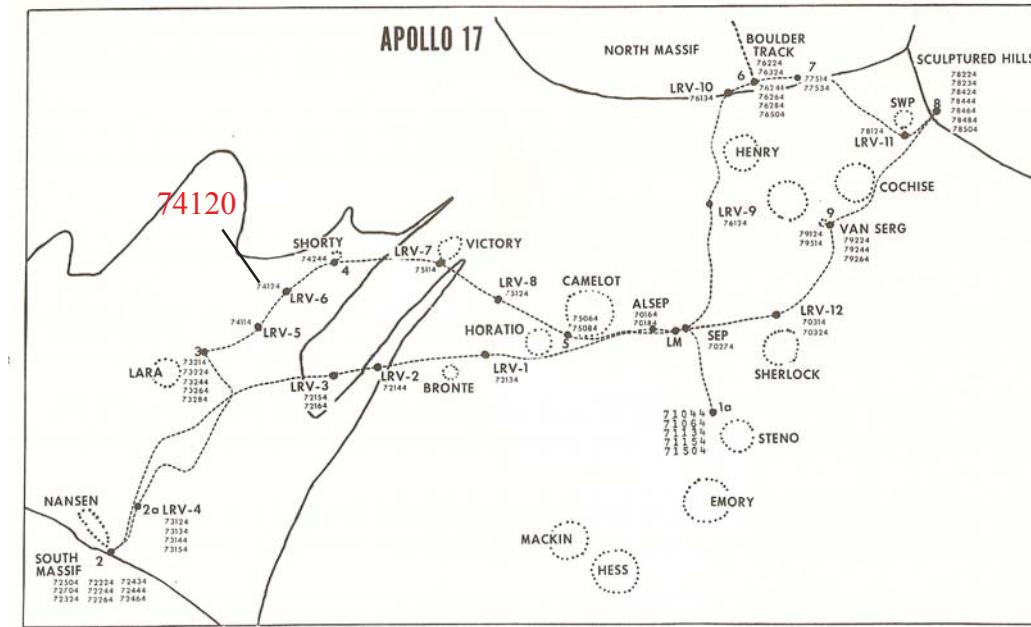

Figure 1: Location of soil sample 74120 at LRV-6 on Apollo 17 map (Meyer 1973). S73-24071

Introduction

74120-74124 was collected at LRV-6 on the light mantle (landslide off of South Massif)(figure 1). It has a high Al_2O_3 and low FeO content (figure 2) and is very mature (figure 3).

Petrography

The maturity index of 74121 is $I/\text{FeO} = 88$ and the average grain size is 47 microns (Morris 1978, Graf 1993). This is a mature soil from the upper few centimeters and contains a high percentage (52%) of agglutinates.

Heiken and McKay (1974) reported only 2 % basalt in the 90 – 150 microns size fraction.

Chemistry

Duncan et al. (1974), Nava et al. (1974), Philpotts et al. (1974), Wanke et al. (1974), Mason et al. (1974) and others all analyzed the < 1 mm fine fraction with consistent results (see table). This soil has high Ni, Ir and Au content, consistent with its high maturity index. The Zn may be from nearby Shorty Crater.

Moore et al. (1974) determined 140 ppm carbon (figure 3).

Cosmogenic isotopes and exposure ages

Curtis and Wasserburg ('1977) determined the Gd isotopes to obtain the total exposure to cosmic rays.

Modal content of soil 74121 (90-150 micron).

From Heiken and McKay 1974.

	74121
Agglutinates	51.7
Basalt	2
Breccia	24.7
Anorthosite	1.4
Norite	0.7
Gabbro	
Plagioclase	7.3
Pyroxene	4.7
Olivine	0.3
Ilmenite	0.7
Orange glass	0.3
Glass other	5.8
