

15340

GLASS/REGOLITH BRECCIA (?)

ST. 7

0.9 g

INTRODUCTION: 15340 appears to be dominantly-vesicular glass with regolith breccia either embedded within it or acting as a substratum (Fig. 1). The sample was very dusty, and because of that no zap pits were obvious. The sample has never been subdivided or allocated. It was collected as part of the rake sample from the north-east rim of Spur Crater.
