

Foil C2102N,1

Contains a very large crater for consortium studies

Foil was split into 2 halves;

...., 4 was allocated to Clemett and he characterized some of the surface contaminants; however, it turns out that Clemett's half did not contain the large crater due to some allocation/processing mistake; the sample was returned to the curator.

....,1 contained the crater and was allocated /transferred to Clemett who is currently analyzing it.

Following Clemett's work, the crater is slated to go to Stephan and then to Kearsley, before it is allocated to some FIB group (TBD) and potential nana-SIMS work (TBD)
